

Tagging is a central concept in this project. Most of the features revolve around the use of tags to organize and search for files and folders. This is why most of the features extend the tagging use case. Folder templates are a separate feature that allows users to create templates of commonly used folder structures so they can be easily reused. Otherwise, users must recreate each individual folder, which inevitably promotes bad folder structure when a user understandably becomes too lazy to create them. Saving templates allows users to drop in folder structures into directories so that it is easy to replicate it as much as is needed. This is why template drag and drop is an extension of folder templating.

In contrast to other tag based file management tools, this software directly organizes your files instead of just providing a means for searching. It will help solve the problem of poor file management by directly organizing folders using tags as a way to make sense of them. Auto tagging / managing features will take some of the responsibility off the user in keeping their folders organized.
